

CONTACT SYNCING AND CREDENTIALS MADE EASY

Active Directory is a software published by Microsoft that allows organizations large and small to organize their users and data. Regroup's integration with Microsoft Active Directory allows you to connect your Azure, Exchange or Office365 Active Directory services to our platform for easy contact importing and authentication management.

EASILY CREATE & SYNC CONTACTS

Active Directory is a widely-used system for managing an organization's databases. With Regroup's optional integration, you can easily import an entire organization's user base or specific organizational units. You'll also be able to maintain groups that mirror your AD database structure within your Regroup account.

When contacts and their information are updated in your Active Directory system, changes will sync automatically to your Regroup account on a nightly basis. You can also run a manual sync of information, if desired.

AUTHENTICATION & CREDENTIALS

If your organization uses Active Directory to manage credentials and authentication, you can also enable Single Sign-On (SSO) for your Regroup network using the same information. SSO Authentication will be configured as part of your onboarding process with Regroup's Customer Success team. Regroup's Active Directory integration will support the most common SSO protocols: SAML (Security Assertion Markup Language), LDAP/LDAP/S (Lightweight Directory Access Portal), and CAS (Central Authentication Service)

Our integration with Active Directory makes it simple for you by only having to update contact information in one place within active directory. We take care of the rest!

HOW OTHERS USE ACTIVE DIRECTORY

ENTERPRISES

Corporations use Active Directory Integration to simplify business operations management, such as automation of staff turnover on consolidation of separate data systems.

HEALTHCARE

Comply with data privacy regulations using a VPN to connect to the client's Active Directory, providing additional safety and security.

EDUCATION

Use Regroup to notify students of delinquencies, eligibility changes, grades, and more. The Educational Institution sets the appropriate attributes in their Active Directory, and the integration updates Regroup. The client can maintain a single data repository that provides Contact and Access information for Regroup and other Third Party applications to consume.
